

Dabur Gen-Z Wellness Range Marketing Mix Model + GTM Strategy

Prepared by: Yashu Mittal

July 2026

Self-directed portfolio/learning project, not an official Dabur document. Only aggregate figures (total ad spend, total revenue, digital-shift trend) are real and cited; channel-level splits and monthly data are analyst-modeled simulations calibrated to those real figures. Full sourcing in Section 3; every data point used in the model is reproduced in the appendices below for full transparency.

Appendix C — Full Model Fit Diagnostics (All 24 Months).....	10

1. Executive Summary

This project builds a data-backed Gen-Z go-to-market strategy for Dabur's Immunity & Wellness range (Chyawanprash, Honey, Glucose-D, wellness gummies), combining a Marketing Mix Model (MMM-lite) that quantifies channel-level marketing ROI with a primary-research-based Gen-Z positioning and channel strategy.

The MMM finds that, across four consolidated channels, Traditional Media (TV+Print) and Trade Promotion & Sampling show the highest return per rupee spent (~9.98x and ~8.90x respectively), Digital Display & Search shows moderate return (~5.92x), and Influencer/Social shows the lowest measured ROI in this dataset (~3.31x) though it likely carries brand-building value the model does not fully capture (Section 7).

A budget-reallocation scenario shifting Rs 3 crore annually from Influencer/Social to Traditional Media projects a net incremental gain of approximately Rs 20.01 crore in annual sales, holding total budget constant.

This report includes, in the appendices, every row of underlying data used by the model: the full 24-month spend and sales dataset, the adstock-transformed values, and the actual-vs-predicted diagnostics for every month so every number quoted in this report can be traced back to its source calculation.

2. Project Objective & Scope

Objective: Quantify how Dabur's Immunity & Wellness range should allocate its marketing budget across channels, and use that quantification to inform a Gen-Z-focused, digital-first repositioning strategy for a legacy Ayurvedic category.

Why this brand and category

Dabur was selected because it sits at the intersection of two of the prior projects: a FMCG D2C brand (Hesthetic Life Pvt. Ltd. internship) and Gen-Z consumer research for a legacy FMCG brand (Hindustan Unilever L.I.M.E. — Lakmé). Dabur's own public statements confirm it is actively pursuing a science-based Ayurveda repositioning and a shift toward younger, digital-first audiences making this a realistic, current strategic problem.

Why four channels

TV and Print were merged into one “Traditional Media” variable. With only 24 monthly observations, five separate spend variables left too little data per parameter to estimate stable, reliable coefficients a real constraint in MMM known as multicollinearity / low identifiability. Merging closely related, lower-budget channels is a standard practical fix, and a genuine methodological judgment call rather than a shortcut.

3. Data Sources & Full Assumptions

Real, cited figures

Figure	Value	Source
Dabur FY2025 total Advertising & Publicity spend	Rs 864.64 crore	BestMediaInfo, 7-May-2025
Dabur FY2025 consolidated revenue	Rs 12,563 crore	Moneycontrol, 7-May-2025
A&P spend as % of revenue (cited range)	~7-8%	MatrixBCG, Dabur Marketing Strategy analysis
>35% of media spend shifting to digital channels	Directional trend	MatrixBCG, Dabur Marketing Strategy analysis

Every modeled assumption used in the model (complete list)

Dabur does not publicly disclose brand-level or channel-level media spend splits. Every one of the following inputs is either a real cited figure, a live formula, or a flagged analyst assumption exactly as it appears in the 'Assumptions' tab of the accompanying Excel workbook.

Assumption	Value	Type	Source / Basis
Dabur FY2025 total A&P spend (Rs crore)	864.64	REAL	BestMediaInfo, 7-May-2025 (see Read Me tab)
Dabur FY2025 consolidated revenue (Rs crore)	12563	REAL	Storyboard18, 7-May-2025 (see Read Me tab)
A&P spend as % of revenue (implied)	0.0688	FORMULA	~7% cited
Immunity & Wellness range share of total A&P budget	0.08	ASSUMPTION	Analyst assumption for portfolio scoping
Implied annual category marketing budget (Rs crore)	69.1712	FORMULA	Equals Total A&P spend x category share
Traditional Media (TV+Print) average share of category budget	0.35	ASSUMPTION	Modeled starting mix
Digital Display & Search average share of category budget	0.27	ASSUMPTION	Modeled starting mix
Influencer/Social average share of category budget	0.26	ASSUMPTION	Modeled starting mix, weighted up given Gen-Z focus
Trade Promo & Sampling average share of category budget	0.12	ASSUMPTION	Modeled starting mix
Adstock decay rate — Traditional Media	0.5	ASSUMPTION	Higher carryover typical of mass broadcast media (industry rule-of-thumb range 0.3-0.7)
Adstock decay rate — Digital Display & Search	0.3	ASSUMPTION	Faster decay — search/display intent is largely immediate
Adstock decay rate — Influencer/Social	0.45	ASSUMPTION	Moderate carryover — content resurfaces via shares/algorithm for a few weeks

Assumption	Value	Type	Source / Basis
Adstock decay rate — Trade Promo & Sampling	0.15	ASSUMPTION	Very fast decay — promo-driven purchase is largely immediate
Base monthly category sales before marketing effect (Rs crore)	45	ASSUMPTION	Modeled baseline; anchors the regression intercept to a plausible category size
Seasonality uplift — Oct to Feb (immunity season)	0.18	ASSUMPTION	Reflects real seasonal immunity-category demand pattern (winter cold/flu season in India)
Seasonality discount — Jun to Aug (monsoon/low season)	-0.1	ASSUMPTION	Reflects lower discretionary wellness purchase in monsoon months

4. Adstock transformation

Marketing effects carry over: a rupee spent this month keeps influencing sales into future months, modeled as $\text{Adstock}(t) = \text{Spend}(t) + \text{decay} \times \text{Adstock}(t-1)$, with decay rates set per channel (Section 3).

Regression

Monthly sales (Rs crore) is regressed on adstocked spend across the four channels using Excel's LINEST function. Model fit is computed transparently via an Actual-vs-Predicted table (Appendix C) rather than relying on LINEST's opaque built-in statistics block.

5. Results Channel Contribution & ROI

Channel	Total Spend (Rs Cr, 24mo)	Attributed Sales (Rs Cr)	Contribution %	ROI (x)
Traditional Media (TV+Print)	51.35	512.62	50.3%	9.98x
Digital Display & Search	37.49	221.81	21.8%	5.92x
Influencer/Social	39.93	132.22	13.0%	3.31x
Trade Promo & Sampling	17.04	151.55	14.8%	8.90x

Model fit: $R^2 = 74.1\%$, F-statistic = 13.6 (k=4 predictors, n=24 months). The model explains roughly three-quarters of month-to-month sales variation reasonable for a 24-month lite model, but not strong enough to treat these ROI figures as precise. Treat them as directional.

6. Budget Reallocation Scenario (Full Detail)

Channel	Current Spend (Rs Cr)	Shift (Rs Cr)	New Spend (Rs Cr)	ROI (x)	Incremental Sales (Rs Cr)
Traditional Media (TV+Print)	51.35	3	54.35	9.98x	29.95
Digital Display & Search	37.49	0	37.49	5.92x	0.00
Influencer/Social	39.92	-3	36.92	3.31x	-9.94

Channel	Current Spend (Rs Cr)	Shift (Rs Cr)	New Spend (Rs Cr)	ROI (x)	Incremental Sales (Rs Cr)
Trade Promo & Sampling	17.04	0	17.04	8.90x	0.00

Net projected incremental sales from this reallocation: Rs 20.01 crore, holding total budget constant (shifts sum to zero).

Caveat: this scenario assumes channel effects are linear and independent at the margin. In reality, returns diminish as spend increases in any one channel, and channels interact (e.g., influencer content often drives search/digital response). Treat this as a directional argument for shifting the mix, not a precise budget order.

7. Model Fit & Limitations

- Channel-level spend data is simulated, calibrated to real aggregate figures — not Dabur's actual internal numbers.
- 24 months of data is a small sample for a 4-variable regression; coefficients carry meaningful uncertainty (no formal confidence intervals in this lite model).
- Influencer/Social's low measured ROI likely understates its true value — MMM struggles to capture longer-term brand equity and word-of-mouth effects versus the immediate, easily-measured response to trade promotions and traditional media.
- The model assumes linear returns; real media effects typically show diminishing returns at higher spend levels, which this lite version does not model.
- Always describe this project as a modeled simulation calibrated to public data when presenting it — not as Dabur's actual internal marketing data.

8. GTM Primary Research Plan

To ground the Gen-Z positioning in real insight, the following primary research plan should be executed (target: 100+ survey respondents + 8-10 interviews, ages 18-27), mirroring the methodology used in the author's Hindustan Unilever L.I.M.E. — Lakmé Gen-Z Consumer Strategy project.

- Consumption frequency of wellness/immunity products
- Unprompted brand association with 'Dabur' / 'Chyawanprash'
- Whether Ayurvedic wellness brands are seen as 'for young people' or 'for parents/grandparents'
- Top purchase-decision factors (taste/format, price, scientific backing, brand trust, influencer/friend recommendation)
- Discovery platforms (Instagram, YouTube, word of mouth, in-store)
- Willingness to try modern formats (gummies, shots, on-the-go sachets)
- Importance of sustainability/clean-label messaging

- Net-Promoter-style brand recommendation likelihood

Full questionnaire, interview guide, and a response-tally template are in the 'GTM Research Plan' tab of the accompanying Excel workbook. Apply the Insight → Tension → Resolution framework (from the Lakmé project) to the results to finalize positioning.

Appendix A — Full 24-Month Monthly Spend & Sales Data (Rs Crore)

Every row below is a direct export of the 'Monthly Data' tab in the accompanying Excel workbook. All figures are analyst-modeled/simulated, calibrated to real FY2025 aggregate figures (Section 3).

Month	Traditional Media	Digital Disp & Search	Influencer/ Social	Trade Promo	Total Spend	Sales
Apr-24	2.263	0.872	1.672	0.941	5.748	56.03

Mar-26	1.835	1.265	1.539	0.907	5.546	65.18

Appendix B — Full Adstock-Transformed Spend Data (Rs Crore)

$\text{Adstock}(t) = \text{Spend}(t) + \text{decay} \times \text{Adstock}(t-1)$. This captures each channel's carryover effect — spend in one month continues to influence sales in subsequent months, decaying at the channel-specific rate.

Month	Traditional Media	Digital Disp&Search	Influencer/Social	Trade Promo
Apr-24	2.263	0.872	1.672	0.941
May-24	2.728	1.610	2.475	1.031
